

Barpenta

Timothy

Palatability and superior winter hardiness are Timothy's most important features. It does very well on wet, peaty and heavy textured soils. The establishment of this species is rather slow and summer production is somewhat limited. Timothy tolerates a cutting management well, while only a few varieties perform well under grazing. Late varieties are better suited for grazing.

Timothy

- Very late maturing
- Late heading
- Diverse

Barpenta is the latest improved timothy variety from Barenbrug. Despite being a very late-heading variety, it is a high dry matter yield producer. Barpenta is suited for timothy hay producers who like to diversify their acreage with varieties maturing throughout the season. This aids in spreading the hay swathing and baling workload throughout the season.
