

Myco Seed Treat[®]

Our Focus
Your Foundation
PROFITABLE SOIL

Enhanced Seedling Vigor

Myco Seed Treat[®] (MST) is a dry blend of bacteria and fungi that contains a nutrient package to support the soil microbiology, the under-cover crop, during establishment.

As a seed treatment, MST contains 15 different species of microorganisms. MST provides a beneficial zone of microbes surrounding the seed which form a symbiotic relationship with the plant's roots.

By providing more surface area surrounding the root, the amount of water and nutrients that are absorbed by the plant increases.

With MST's high concentration of microorganisms and an initial food source, the microbes start to grow immediately at planting.

The microbes in MST colonize the rhizosphere of each planted seed while the food sources and nutrients help the microbes get established.

Product Application:

Myco Seed Treat[®] works on all crops and is commonly mixed into the planter's seed box.

Uniform Stands

The crop benefits by the microorganisms freeing up nutrients - with an end result of better nutrient cycling.

Growers often report that they receive enhanced seedling vigor with their MST applications.

3 Weeks After Planting

Increased development of fine roots is a typical result of MST treatments and offers farmers these benefits:

- Increased Microbial Activity
- Increased Nutrient Availability
- Improved Nutrient Cycling

Great Return on Investment

At AgriEnergy Solutions, we believe Biological Farming is the future of agriculture - and healthy soil is the foundation of profitable crop production.

Give us a call today to learn more about using Myco Seed Treat[®] to kick off your conventional or organic crops with a flourish.
