

In today's dairy enterprise, components AND yield are both critical to PROFITABILITY.

Often various commodities are added to a TMR, specifically to address energy or protein or fiber needs. Adjusting the ration to include at least 3 to 5 pounds of well-made or green chopped grass can help address all three while building your bottom-line.

We work with **BARENBRUG**, one of the world's largest grass seed companies with over 100 years of grass forage experience. 'Nutri-Fiber' grass products from BARENBRUG have genetic potential for high-yield and digestibility.

Either in combination with an **FSM Brand** alfalfa or alone, **Nutri-Fiber** grasses when properly fertilized to achieve maximize nutritive content and harvested at the right time can provide **exceptional digestible energy, protein AND rumen-effective fiber.**

Consider three ways to work highly digestible grass into your TMR:

- **1. PLANT** a BARENBRUG 'Nutri-Fiber' product like Milkway (multi-year) or **Green Spirit** (short rotation) for green chop or baleage. More info <u>HERE</u>
- USE FSM Brand HQ-W, a blend of agronomically sound, high-leaf to stem ratio alfalfa with 'Nutri-Fiber' grasses. More info <u>HERE</u>
- 3. FEED your forage to maximize quality with a BioEnhanced Forage Fertility program from AgriEnergy Solutions. More info <u>HERE</u>

Need assistance with integrating highly digestible grass into your TMR? We are always glad to help... it's what we do. Give us a call today!
